

# Moving Data

If you wish to move a Partek Flow project data from one disk to another and continue using the project, please follow the steps below:

1. Use rsync to copy the project data from the old disk to the new disk. For example, if you wish to move Project A from an internal disk to an external drive mounted as hdd:

```
$ rsync -avr /home/user/FlowData/Project_A /mnt/HDD/FlowData2/Project_A
```

Using rsync -avr guarantees that the time stamps would not change.

2. In Partek Flow, login as a user with Admin privileges. Go to **Settings>Directory permissions** page
3. In the **Directory Reassignment** section, type the Former directory and select the Current directory (Figure 1)

For example:

- Former directory: /home/user/FlowData/Project\_A
- Current directory: /mnt/HDD/FlowData2/Project\_A

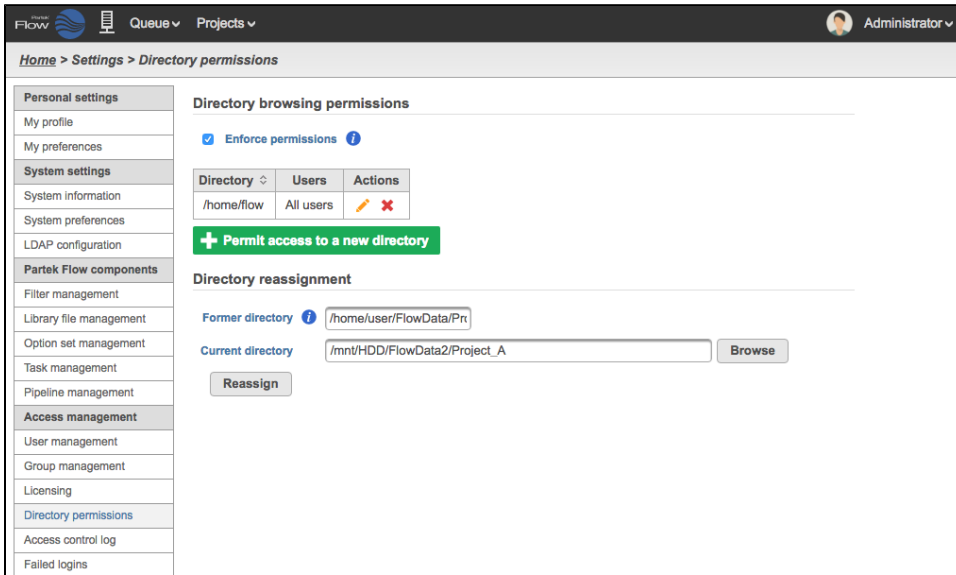

Figure 1: Directory Reassignment

4. Select **Reassign** button
5. Open the project.
  - In the Analyses tab, check if the Project disk space on the lower right has been updated
  - In the Data tab, check the project output directory has changed to the new directory
6. You can now remove the former directory
